

iVALT – The Missing Identity Layer in Zero Trust Security

1-CLICK TO ZERO TRUST™ WITH 5 FACTORS

iVALT provides real-time, unassailable identity for people and endpoints using five dynamic factors i.e. mobile biometrics, PKI-backed identity, device authentication, GPS verification, and time-based validation.

Our platform powers three core solutions:

DocuID® :- identity-bound secure document access and control.

OnDemand ID™ :- real-time identity verification for humans, IoT devices, and AI agents.

Universal Biometric ID® :- passwordless, mobile-first workforce authentication for IAM.

Together, they deliver AI-resistant, Zero Trust identity assurance across enterprise, financial services, healthcare, and government environments, in just one click.

The Identity Crisis We're Solving

Today's digital world still runs on weak credentials, passwords, OTPs, tokens, and basic certificates. These legacy controls cannot withstand modern attacks including AI-driven impersonation, credential theft, synthetic identities, and deepfakes.

At the same time:

- 80%+ of cyberattacks begin with compromised credentials
- IoT devices and AI agents now outnumber humans
- Identity assurance is now the foundation of Zero Trust

Yet most organizations continue to authenticate the session and not the identity.

iVALT changes that:

We deliver real-time identity and context verification across humans, IoT devices, and AI agents that enables true Zero Trust at the identity layer.

1-Click Identity With 5 Real-Time Factors

iVALT eliminates passwords and static credentials with AI-resistant, frictionless identity verification in one click.

Our 5-Factor Model includes:

- Mobile Biometric Identity (Face/Fingerprint Match)
- PKI-Backed Mobile Identity
- Device Identity Binding
- GPS-Based Location Validation
- Timestamp & Session Context

Optional dynamic environmental factors add an additional layer of trust when required.

This delivers "Zero Doubt" identity verification, not just Zero Trust access.

PKI-Backed Identity Protection Key

iVALT strengthens identity further through PKI-based cryptographic binding for every user, device, and machine.

Each identity receives a unique Identity Protection Key enabling:

- Transaction-level authentication
- Secure document access
- Non-repudiation
- Tamper-proof audit logs
- AI-resistant identity validation

This shifts identity security from reactive to proactive.

iVALT ensures the right person or the right system accesses the right resource, every time.

Core Solutions:

• DocuID® : Secure Document Access Reinvented

Protect sensitive documents by embedding identity-based access into the document itself.

Only verified recipients can open files based on: Mobile number, Biometric identity, PKI trust key, GPS & time validation

Prevents:- Forwarding | Printing | Screenshot capture | Unauthorized access

• OnDemand ID™ : Real-Time Caller & Interaction Identity

Verify the identity of any caller, message sender, or interaction participant in real-time.

Prevents:- Deepfake fraud | Voice spoofing | Social engineering | Impersonation attacks

• Universal Biometric ID® : Enterprise IAM Identity Fabric

Replace passwords with mobile-first biometric identity across enterprise systems.

Delivers:- Secure login | Lower friction | Reduced credential risk | Seamless IAM integration

Why iVALT:

iVALT is the industry's first real-time identity trust platform that:

- Combines biometrics + PKI + device + location + time
- Works across humans, AI agents & IoT
- Delivers 1-click authentication
- Integrates with existing IAM & security stacks
- Makes Zero Trust actually achievable
- Future Proof

We do not protect passwords, We eliminate the need for them.

iVALT is building the universal trust layer for the digital world, where every identity is verified, every interaction is trusted, and every access decision is certain.
